Lecture 27: Text as Data

Big Data and Machine Learning for Applied Economics Econ 4676

Ignacio Sarmiento-Barbieri

Universidad de los Andes

November 17, 2020

Announcements

- Problem Set 3: Check the data set, I changed it. I had forgotten a variable Npobres. You can still use the previous one to train the model. But the submission should be with the new data set.
- The submission of the <u>.csv</u> is on <u>Wednesday at November 18 at 8:00 pm</u>. Please send it via slack with the number of parameters in your model. If you forget to send me the number of parameters I'll assign 100,000
- We need to decide the Final Exam Window: I posted a poll (<u>please vote once</u>). Possible dates:
 - ▶ December <u>3 from 2pm (Thursday) to December 5, 2pm (Saturday)</u>
 - ▶ December 7 from 8am (Monday) to December 9, 8am (Wednesday)
 - December 9 from 8am (Wednesday) to December, 11 8am (Friday)
 - ▶ If none of these work we can tweak them a little bit
- Exam dates are from December 7 to 17
- ▶ Project proposal deadline December 7,

Agenda

- 1 Recap: XGBoost
- 2 Text as Data
 - Tokenization
 - Tokenization Demo
- 3 Text Regression
 - Text Regression: Example
- **4** Topic Models
 - PCA
- 5 Review & Next Steps
- 6 Further Readings

XGBoost: Demo

- From Caret's manual
- eXtreme Gradient Boosting
 - method = 'xgbTree'
 - ► Type: Regression, Classification
 - Tuning parameters:

```
nrounds (# Boosting Iterations)
max_depth (Max Tree Depth)
eta (Shrinkage) < 0,1
gamma (Minimum Loss Reduction)
```

colsample_bytree (Subsample Ratio of Columns) min_child_weight (Minimum Sum of Instance Weight)

- 🛠 subsample (Subsample Percentage)
- Required packages: xgboost, plyr
- ► A model-specific variable importance metric is available.

Instell packages ("caret")

dependences=TRU)

3 / 32

Text as Data: The Big Picture

- ► Text is a vast source of data for research, business, etc
- ▶ It comes connected to interesting "author" variables
 - What you buy, what you watch, your reviews
 - Group membership, who you represent, who you email
 - ► Market behavior, macro trends, the weather

Text as Data: Motivation

Econometrica, Vol. 78, No. 1 (January, 2010), 35-71

WHAT DRIVES MEDIA SLANT? EVIDENCE FROM U.S. DAILY NEWSPAPERS

By Matthew Gentzkow and Jesse M. Shapiro¹

We construct a new index of media slant that measures the similarity of a news outlet's language to that of a congressional Republican or Democrat. We estimate a model of newspaper demand that incorporates slant explicitly, estimate the slant that would be chosen if newspapers independently maximized their own profits, and compare these profit-maximizing points with firms' actual choices. We find that readers have an economically significant preference for like-minded news. Firms respond strongly to consumer preferences, which account for roughly 20 percent of the variation in measured slant in our sample. By contrast, the identity of a newspaper's owner explains far less of the variation in slant.

KEYWORDS: Bias, text categorization, media ownership.

Text as Data: Motivation

Gentzkow and Shapiro: What drives media slant? Evidence from U.S. daily newspapers (Econometrica, 2010)

- ▶ Build an economic model for newspaper demand that incorporates political partisanship (Republican vs Democrat)
 - ▶ What would be independent profit-maximizing "slant"?
 - ► Compare this to slant estimated from newspaper text.
- ► use data from Congress to isolate the phrases 2001 (199)
- ➤ Compare phrase frequencies in the newspaper with phrase frequencies in the 2005 Congressional Record to identify whether the newspaper's language is more similar to that of a congressional Republican or a congressional Democrat

Republican	Democratic
death tax 🖊	estate tax /
tax relief /	tax break /
personal account	private account
war on terror	wa <u>r</u> in Iraq

Text as Data: Motivation

Giving Content to Investor Sentiment: The Role of Media in the Stock Market

PAUL C. TETLOCK*

ABSTRACT

I quantitatively measure the interactions between the media and the stock market using daily content from a popular Wall Street Journal column. I find that high media pessimism predicts downward pressure on market prices followed by a reversion to fundamentals, and unusually high or low pessimism predicts high market trading volume. These and similar results are consistent with theoretical models of noise and liquidity traders, and are inconsistent with theories of media content as a proxy for new information about fundamental asset values, as a proxy for market volatility, or as a sideshow with no relationship to asset markets.

7/32

Information Retrieval and Tokenization

► A passage in 'As You Like It' from Shakepeare:

All the world's a stage, and all the men and women merely players: they <u>have</u> their exits and their entrances; and one man in his time plays many parts...

► What the econometrian sees:

► This is the Bag-of-Words representation of text.

8/32

Possible tokenization steps

- Remove words that are super rare (in say $<\frac{1}{2}\%$, or <15% of docs; this is application specific). For example, if Argentine occurs only once, it's useless for comparing documents.
- ▶ Stemming: 'tax' \leftarrow taxing, taxes, taxation, taxable, ... A stemmer cuts words to their root with a mix of rules and estimation. 'Porter' is standard for English. En esperal
- ▶ Remove a list of stop words containing irrelevant tokens. If, and, but, who, what, the, they, their, a, or, ... Be careful: one person's stopword is another's key term.
- ► Convert to lowercase, drop numbers, punctuation, etc ... Always application specific: e.g., don't drop(:-) from tweets.

The *n*-gram language model

- An *n*-gram language model is one that describes a dialect through transition probabilities on *n* consecutive words.
- ► An *n*-gram tokenization counts length-*n* sequences of words. A unigram is a word, bigrams are transitions between words. e.g., world.stage, stage.men, men.women, women.play, ...
- ▶ This can give you rich language data, but be careful: *n*-gram token vocabularies are very high dimensional (p^n)
- More generally, you may have domain specific 'clauses' that you wish to tokenize.
- There is always a trade-off between complexity and generality.

 Often best to just count words
- ► Often best to just count words.

Department of Economics, University of Texas, Austin, TX 78712-1173, USA
Received 14 June 2004; accepted 21 July 2004

Abstract

Adjusted for many other determinants, beauty affects earnings; but does it lead directly to the differences in productivity that we believe generate earnings differences? We take a large sample of student instructional ratings for a group of university teachers and acquire six independent measures of their beauty, and a number of other descriptors of them and their classes. Instructors who are viewed as better looking receive higher instructional ratings, with the impact of a move from the 10th to the 90th percentile of beauty being substantial. This impact exists within university departments and even within particular courses, and is larger for male than for female instructors. Disentangling whether this outcome represents productivity or discrimination is, as with the issue generally, probably impossible.

Beauty in the classroom: instructors' pulchritude and putative

Text Regression

Topic Models

- ► Text is super high dimensional
- ▶ there is often abundant *unlabeled* text
- ➤ Some times unsupervized factor model is a popular and useful strategy with text data
- ➤ You can first fit a factor model to a giant corpus and use these factors for supervised learning on a subset of labeled documents.
- ▶ The unsupervised dimension reduction facilitates the supervised learning

Topic Models: Example

- We have 6166 reviews, with an average length of 90 words per review, we8there.com.
- ► A useful feature of these reviews is that they contain both text and a multidimensional rating on overall experience, atmosphere, food, service, and value.
- For example, one user submitted a glowing review for Waffle House #1258 in Bossier City, Louisiana: I normally would not revue a Waffle House but this one deserves it. The workers, Amanda, Amy, Cherry, James and J.D. were the most pleasant crew I have seen. While it was only lunch, B.L.T. and chili, it was great. The best thing was the 50's rock and roll music, not to loud not to soft. This is a rare exception to what you all think a Waffle House is. Keep up the good work.

Overall: 5, Atmosphere: 5, Food: 5, Service: 5, Value: 5.

Topic Models: Example

- ▶ After cleaning and Porter stemming, we are left with a vocabulary of 2640 bigrams.
- ► For example, the first review in the document-term matrix has nonzero counts on bigrams indicating a pleasant meal at a rib joint:

```
## even though larg portion mouth water red sauc babi back back rib chocol mouss
## 1 1 1 1 1 1 1 1
## were satisfi
```

Topic Models: Example

- ▶ We can apply PCA to get a factor representation of the review text.
- ▶ PC1 looks like it will be big and positive for positive reviews,

0.06184512

```
pca <- prcomp(x) scale=TRUE) # can take a long time

tail(sort(pca$rotation[,1]))

## food great staff veri excel food high recommend great food
## 0.007386860 0.007593374 0.007629771 0.007821171 0.008503594

## food excel
## 0.008736181

while PC4 will be big and negative

tail(sort(pca$rotation[,4]))</pre>

Principal Component Analysis

▶ Dimensionality via main components

$$X = (x_1, x_2, \dots, x_n)_{N \times K} \tag{2}$$

► Factor:

$$F = X\delta \ \delta \in K \tag{3}$$

- ▶ Idea: summarize the K variables in a single (F).
- \blacktriangleright Vocab: the coefficients of *δ* are the loadings: how much 'matters' each x s in the factor.
- ightharpoonup Dimensionality: summarize the original K variables in a few q < K factors.

Algebra Review

- ▶ Let $A_{m \times m}$. It exists
 - ightharpoonup a scalar λ such that $Ax = \lambda x$ for a vector $x_{m \times 1}$,
 - ightharpoonup if $x \neq 0$, then λ is an eigenvalue of A.
- ▶ and a vector x is an eigenvector of A corresponding to the eigenvalue λ .
- $ightharpoonup A_{m \times m}$ with eigenvalues $\lambda_1, \lambda_2, \dots, \lambda_m$, then:

$$tr(A) = \sum_{i=1}^{m} \lambda_i \tag{4}$$

$$det(A) = \prod_{i=1}^{m} \lambda_i \tag{5}$$

- ▶ If $A_{m \times m}$ has m different eigenvalues, then the associated eigenvectors are all linearly independent.
- ▶ Spectral decomposition: $A = P\Lambda P$, where $\Lambda = diag(\lambda_1, ... \lambda_n)$ and P is the matrix whose columns are the corresponding eigenvectors.

◆□▶◆圖▶◆臺▶◆臺▶ 臺 釣९○

- \triangleright x_1, x_2, \dots, x_K , K vectors of N observations each.
- ightharpoonup Factor: $F = X\delta$
- ▶ What is the 'best' linear combination of $x_1, x_2, ..., x_K$?
- ▶ Best? Maximum variance. Why? The one that best reproduces variability original of all xs

- ► Let
 - $ightharpoonup X = (x_1, \ldots, x_K)_{N \times K},$
 - $\triangleright \Sigma V(X)$
 - $\delta \in K$
- ► $F = X\delta$ is a linear combination of X, with $V(X\delta) = \delta' \Sigma \delta$.
- Let's set up the problem as

$$\max_{\delta} \ \delta' \Sigma \delta \tag{6}$$

▶ It is obvious that the solution is to bring δ to infinity.

Let's "fix" the problem by normalizing δ

$$\max_{\delta} \delta' \Sigma \delta$$
 (7) subject to
$$\delta' \delta = 1$$

- ▶ Let us call the solution to this problem δ^* .
- $F^* = X\delta^*$ is the 'best' linear combination of X.

- ▶ Result: δ^* is the eigenvector corresponding to the largest eigenvalue of $\Sigma = V(X)$.
- $F^* = X\delta^*$ is the first principal component of X.
- ▶ Intuition: X has K columns and $Y = X\delta$ has only one. The factor built with the first principal component is the best way to represent the K variables of X using a single single variable.
